

From a review of *Replication and Evidence Factors in Observational Studies* published in *Biometrics* 2021;77:1495-1498, doi:10.1111/biom.13535, by Rajarshi Mukherjee.

“Overall, I consider the book to be a rich resource for introducing this relatively new yet highly impactful area of research.

The book is organized into four Sections. ... Section II sets the tone for the rest of the book by collecting carefully chosen examples. ... Chapter 4 provides five real studies to elicit aspects of evidence factors from a variety of representative examples. ... The chapter is supplemented through R codes for the examples covered and hands-on exercises for the interested reader.

Concepts are well elucidated through concrete running examples. ... Section III of the book lends a mathematically rigorous lens to the intuitions gathered from the data analyses and numerical examples in Section II. ... This logic is beautifully explained.”
